Thompson Road Corridor Study

Project Description: This Corridor Study on Thompson Road extends 3.8 miles from Linden Road to Fenton Road. This study explores potential design alternatives and improvements that will help alleviate current and anticipated future congestion along the corridor. Currently, the interchange of US-23 and Thompson Rd. experiences rush hour traffic delays for the northbound and southbound US-23 exit ramps that can back up to US-23. A main cause of this is the lack of roadway capacity between the two Thompson Road traffic signals, often leading to backups from one signal through the other. Addressing the traffic congestion and safety issues at the US-23 Interchange is an urgent priority.
